

# intrawork WebCourt

Increasingly, agencies at the federal, state and local levels are leveraging technology, in particular, the Internet to improve their business processes and to create and deliver informative content and accessible resources and services available on-line from any location 24/7/365.

Silicon Valley-based Intrawork is now bringing such capability to the court system through WebCourt. This technology is soundly based on thorough research of best-in-class court web sites, and custom web application development and integration work completed for the Superior Court of California, Santa Clara County.

Simply put, WebCourt is a stand-alone, custom-built Microsoft FrontPage add-in that allows the quick implementation of the core elements of a web site including standardized navigation, design elements and "look and feel."

Content from an existing web site can also be migrated into the newly created site. Importantly, accessibility is addressed because the resulting site is Section 508 (ADA) compliant.

WebCourt's user-friendly "wizard" and "click-through" features also translate into a straightforward, easily managed and cost-effective web solution from an internal IT perspective. For example, content management and workflow is easily managed by court administrators.

A browser-based version of WebCourt compatible with other web applications is under development.

## INTRAWORK WEBCOURT BENEFITS SUMMARY

- User-friendly set-up
- Section 508 (ADA) compliant
- Quick implementation
- Cost effective
- Standardized navigation and design elements
- Straightforward content management and workflow
- Based on industry standard technology

# about intrawork

Cupertino-based Intrawork is located in the heart of Silicon Valley and the center of technological innovation.

Since its founding in 1995, Intrawork has been committed to working with both private companies and government agencies to meet the unique challenges presented by the constantly changing technology landscape. Such challenges include standardization, usability, scalability, reliability and security.

Intrawork's offering of web development services and solutions leverages the latest technology for its customers.

On the public sector side, this enables government agencies to quickly and cost-effectively enhance communications internally, with the private sector and with its citizens.

For the private sector, companies can enhance internal communications and external communications whether their model is business-to-business (B2B), business-to-consumer (B2C), or both.

Intrawork's expertise is in web application development, database development and a range of programming environments. These include: XML, ASP, ODBC, VB, JSP, PHP, PERL, CGI, C++, and

Java. This deep technical knowledge base enables us to deliver custom tailored solutions that address very specific client requirements.

Intrawork's services and solutions include: on- and off-site web development and implementation of external web sites, extranets and internal web solutions (Intranets); full ISP service, web site and e-mail hosting; user-friendly interface design; custom application building; content writing, editing and migration; interactive PDF-file conversion; ongoing site maintenance, technical support and training.
